What is the house edge in casino games?

assistant:

The house edge, also known as the built-in advantage, is the percentage of money that a casino expects to win from a player over time in a particular game. It's the built-in margin that the casino has to ensure a profit.

The house edge varies from game to game and is usually expressed as a percentage. Here are some common house edges for popular casino games:

1. **Slot Machines**: 5-15% (average 8-10%)

* Some slots have a house edge as low as 2-3%, while others can be as high as 20-30%.

2. **Roulette**: 2.70% (European), 5.26% (American)

* The European version has a single zero, while the American version has a double zero.

3. **Blackjack**: 0.5-1.5% (with optimal strategy)

* The house edge can be reduced to less than 1% with a well-executed strategy.

4. **Craps**: 0.4-1.4% (pass line bet)

* The house edge varies depending on the bet type and the number of players.

5. **Baccarat**: 1.06% (banker bet), 14.36% (player bet)

* The banker bet has a lower house edge, while the player bet has a higher edge.

6. **Video Poker**: 0.4-1.4% (with optimal strategy)

* The house edge can be reduced to less than 1% with a well-executed strategy.

7. **Keno**: 25-30%

* Keno has a relatively high house edge due to its random nature.

8. **Caribbean Stud Poker**: 2.56-5.22%

* The house edge varies depending on the number of players and the bet type.

Keep in mind that these are general estimates, and the actual house edge may vary depending on the specific game, casino, and rules. It's essential to understand the house edge and the rules of each game to make informed decisions when playing at a casino.
